

PRESTO-TAP®
Leak Detection System
LDS 2000/RV

[View/Print/Download PDF Version](#)

Model # LDS 2000/RV (Regulator Valve Leak Detection System)

Designed to be installed into regulator pressure taps (1/8" NPT), into a tank-pressure tap between the tank service valve and the regulator, or downstream from the second-stage regulator (appliance valve pressure tap or service-line shut-off valve pressure tap) for pressure reading purposes without "breaking the system".

Meets NFPA Publications 54 and 58 requirements regarding "excess flow". Provides an easy and quick method of attaching water manometer or other testing device to the regulator and at appliances to obtain low-pressure readings.

NOTE: Will not provide all the attributes of other PRESTO-TAP® LDS products, including verification of liquid in the tank (confirmation of "out-of-gas"), leak detection at the tank service valve, and leaks downstream from the PRESTO-TAP® LDS unless such tank-pressure tap locations are available between the tank service valve and the first-stage regulator 10# location.

Underwriters Laboratories (UL) Listed,
United States Patent 6,209,562 and
Canadian Patent Applied For.
Meets NFPA 54 and 58 Requirements.
